Medicaid-Funded Births in Georgia: 1998-2000

The Maternal and Child Health Epidemiology Section (MCH), Division of Public Health, Department of Human Resources has prepared this report in fulfillment of a contract requirement between the Division of Medical Assistance (DMA) and the Division of Public Health. The MCH Epidemiology Section (formerly known as the Office of Perinatal Epidemiology) has linked the birth certificate file with the Medicaid claims database since 1990. This report provides findings from the linked Medicaid and birth records for calendar years 1998, 1999 and 2000. AutoMatch (a probabilistic linking software program) was used to link the Medicaid claims and birth certificate files.

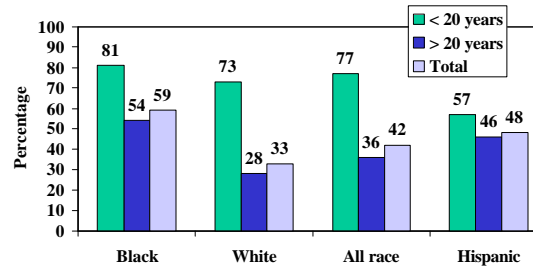

This report provides a summary of Medicaid-funded births in Georgia, maternal participation in perinatal case management and pregnancy related services, and adverse birth outcomes. Information is provided by Georgia Health District (based on mother's residence), race (total, white and black), and age category (<20 and >= 20) for women who delivered a live birth in 1998, 1999 and 2000. Information on women who reported Hispanic ethnicity is also provided. The numbers for Hispanic women are not exclusive of those in the tabulation by race, since women of Hispanic ethnicity are also included in a race group.

Program Participation:

Four out of every ten births to Georgia residents were supported by Medicaid funding during this time period. There were 159,866 births (42% of all births) during the three years for which the birth certificate was linked with a Medicaid claim record for a delivery (Table 22). The proportion of all births that are Medicaid funded has been stable for the last three years, although the proportion has decreased from a high of 49% in the early '90s. The most recent estimates indicate that the proportion of Medicaid births is increasing again, as the economy grows weaker.

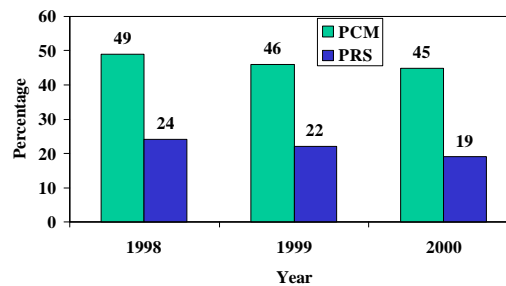

Race and age are both related to poverty status (and thus to Medicaid eligibility), and the participation proportions reflect these associations (Figure 1). Eighty-one percent of births to Black teens (ages < 20) are Medicaid funded; and only 28% of the births to White women ages 20 and greater are Medicaid funded (Table 20). The Hispanic population is increasing in Georgia, with 6.7% of all births in 1998 and 10.1% of births in 2000 to women who reported Hispanic ethnicity. The proportion of Medicaid funded Hispanic births during this time (48%) was between the White (33%) and Black (59%) proportions (Table 20).

Figure 1. The Percent of Medicaid Births, by Maternal Race/ethnicity and Age, GA 1998-2000

Perinatal case management (PCM) and pregnancy related services (PRS) are two service programs that are available to eligible Medicaid clients. During the three-year period, 47% (73,638) of all Medicaid women participated in PCM, and 21% (33,752) participated in PRS (Tables 19 and 20). Participation in both programs declined slightly during the three years (Figure 2).

Figure 2. The Percents of Medicaid Recipients Who Participated in PCM or PRS, GA 1998-2000

Birth Outcomes:

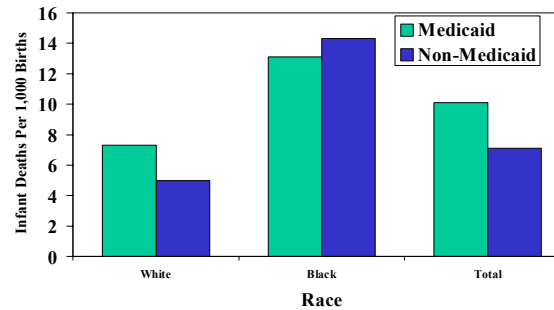

The linked birth / Medicaid file was used to compare birth outcomes for Medicaid-funded births with the outcomes for the non-Medicaid population. The three outcomes of interest were premature delivery (less than 37 weeks gestation), low birth weight (less than 2500 grams), and infant mortality. The Medicaid population had higher rates for all three outcome measures than the non-Medicaid population. Late entry into prenatal care (in the 3rd trimester) or no prenatal care was compared between the Medicaid and non-Medicaid populations, and the Medicaid population also had higher rates for this measure. The following summarizes the state-level results for these four measures:

Infant mortality. Table 1A provides the numbers and rates for infant deaths for the 1998, 1999, and 2000 birth cohorts, by Medicaid status of the infant. Among these three cohorts, 3,189 infant deaths in Georgia were linked to births. Slightly over 50% of the deaths (1,608) were infants whose births were Medicaid-funded. The infant mortality rate (IMR) was 10.1 per 1,000 live births for Medicaid births, compared to 7.1 among non-Medicaid births. The IMR among Medicaid recipients has increased over the three-year period. The infant mortality rate among black Medicaid recipients (13.1 per 1,000 live births) was almost twice as high as the white rate (7.3), reflecting the general two-fold disparity in birth outcomes between the two races. (Table 21) However the Black-White gap is lower in the Medicaid population (13.1 / 7.3) than in the non-Medicaid population (14.3 / 5.0).

Table 1A. Infant Deaths by Medicaid Status, 1998-2000

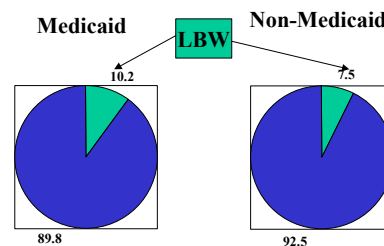

Medicaid	Year						Total	
	1998		1999		2000			
	Numbers	Rates	Numbers	Rates	Numbers	Rates	Numbers	Rates
Yes	493	9.5	523	10.2	592	10.4	1,608	10.1
No	528	7.5	527	7.0	526	7.0	1,581	7.1
Georgia	1,021	8.3	1,050	8.3	1,118	8.5	3,189	8.4

Figure 3. Infant Mortality Rates by Race and Medicaid Status, GA 1998-2000

Low birth weight. Low birth weight (weight < 2,500 grams or < 5.5 pounds) is a major risk factor for infant mortality and morbidity. During the three-year period, 8.6% of all infants born in Georgia weighed less than 2500 grams (Table 22). The differences in LBW rates by Medicaid status and race are similar to the observed differences for infant mortality. The Medicaid / non-Medicaid LBW rates were 10.2 and 7.5, respectively. The racial differences by Medicaid status also reflect the general two-fold racial gap in birth weight. The black / white LBW gap was 12.9 / 7.7 for Medicaid births and 12.4 / 6.0 for the non-Medicaid births.

Figure 4: Percents of Low Birth Weight Rate by Medicaid Status, GA, 1998-2000

Premature Birth. Premature birth (an infant delivered before 37 weeks of gestation) is a second major risk factor for infant mortality. Twelve percent of all births during the three-year period were identified as premature (Table 23). The differences in rates by Medicaid status and race were smaller than the corresponding differences for LBW and IMR. The preterm rate was 13% for Medicaid funded deliveries and 11.2% for non-Medicaid. The black / white premature delivery gap was also slightly smaller for Medicaid babies (15.4 / 10.9) than for non-Medicaid (15.2 / 10.0).

Prenatal care utilization. Late entry into prenatal care (in the third trimester) or no prenatal care is one indicator of prenatal care utilization. Only 2.5% of all GA birth certificates during the three years reported that the mother received no care or entered care in the 3rd trimester (Table 24). This “inadequate” prenatal care measure was higher among Medicaid recipients (3.7%) than among non-Medicaid women (1.7%). The black / white gap was also larger for non-Medicaid population (3.0 / 1.2) than the Medicaid (4.4 / 3.3), although the rates were much higher for the Medicaid population.

Conclusions:

Medicaid enrollments among pregnant Georgia women were relatively stable during the three years covered in this report. One out of every three births to white women was Medicaid funded and three of every five births to black women were Medicaid funded. Medicaid and its related programs (PCM, PRS, WIC) serve 40% of the births in Georgia. These births are to a high risk population (a poorer, younger, higher minority population than the general population). The Medicaid program serves a high-risk population; and the program can improve birth outcomes, reduce the black / white gap in adverse pregnancy outcomes, and reduce long-term costs associated with adverse outcomes. However, participation in two Medicaid programs, PCM and PRS, declined slightly over the three years. Women with Medicaid-funded deliveries were also more likely to have had late or no prenatal care. Efforts within the Medicaid-eligible population of women to increase service utilization could pay dividends in better birth outcomes. (Additional analysis of the available linked birth / Medicaid claims data could examine the associations between PCM / PRS participation and birth outcomes among the Medicaid population.)

The Medicaid population had higher rates for all three adverse pregnancy outcomes than the non-Medicaid population. However, this result is to be expected, given that the Medicaid clients are a “higher risk” population. Although the adverse outcome rates were slightly increased in the Medicaid population, the black / white gap was lower among the Medicaid participants.
